

Unit 1 → Unit 1 + 4 unit (12) CIE 1

- world evolved
- who formed syllabus?
- Chicago
- Hothron Exp (10m) → effect of illuminatⁿ (2 grps)
 (no effect)
 ↗ one with
 ↘ one w/o
- Feel it and get interest

Managers → strategic decision → industry knowledge
→ problem solving → identify issues

→ word tasks
→ allocate resources
→ support & development
→ Employee-Manager relⁿ
→ shape organisation culture

• word & oversee work of others

org structure:

see overall En: CEO

oversee, translate org strat
to plan (Regional)
manage (Supervisors
etc.)

Function of Manager:

P → Plan → set obj & set course of actⁿ & how to achieve
(forecasting etc..)

O → Organize → arrange resources & task in
structured way & put procedure

L → Lead → motivate & direct

C → Control → monitor & Eval performance

Manager Roles:

1. Interpersonal → Leader, heads, interact with Ext + int, maintain Network & provide dirⁿ
2. Informat^l → spokesperson (monitor) disseminator
Gather info from Ext + int and disseminate within org
3. Decisional → Entrepreneur, Resource allocator
make decision abt org dirⁿ, solve problems, allocate resources

POSDCORB

1. Planning → Det org obj & strats & actⁿ, timeline, Slopes
2. Organizing → Give task & Responsibility, create structural hierarchy & allocate resource
3. Staffing → hire, develop talent
4. Directing → make key decision & comm them
5. Co-ord → See all parts of org harmony work, Resolve conflicts & sync activities
6. Reporting → upd stakehold / supervisors, use reports & transparency & accountability
7. Budgeting → financially plan and allocate resources

Cause for Evolution of Managerial Roles

1. Flexible work arrangement → flexible work hrs, Employee judged by task completion
2. Global + Eco changes → uncertainty
3. Tech advancements → constant adaption
4. Customer Imp → intensified focus, connected to their feedback
5. Innovⁿ → need to be creative
6. Sustainability → lead not only by Eco but also Env & socially
7. Employee management → reorg grg on

Classic Approach:

Scientific Management (Wilson Taylor)

- Develop science for each element of work
 - tasks to be scientifically studied
- Scientific Selection & Training
 - select ppl on skill & job req & train them
- Cooperation between Management & workers
- Equal work division → work is equally shared between management & workers
- Worries → Dehumanization (work = robot or over-specialization (break down of work into monotonous))
 - Resistance to change

Toyota Using This

- Each task analysed & broken down
- Optimized Task allocation based on task to workers selected

→ Cont Imp → Monitoring & Cooperⁿ, workers asked for Improvements
 → Work division → Management → C I, maintenance
 → Workers → Assembly tasks

General Administrative Theory (Henri Fayols)

• Max Weber → developed bureaucracy concept (hierarchy)

Fayols
 5 → Plan
 → Organise
 → Lead
 → Control
 → Cooperate

% of labor → Task broken down
 Webers
 bureaucracy → Hierarchy of Authority
 → Formal selectⁿ → Tech qualifⁿ
 → Impersonality → Uniform Rules & procedures
 Written rules + std operⁿ
 Career orientⁿ → Employee = profession^l managers

Fayol's
14

- % of work → Specializⁿ → break down
- Authority → Managers right & order
- Discipline → Employee obey Rules
- Unity of cmd → Receive order from only 1 superior
- Unity of Dirⁿ → 1 plan of actⁿ to Guide workers & managers
- Subordⁿ to General Interest → Group Interest of Employee

Remuneratⁿ → fair compensatⁿ

Centralizⁿ → deg of which Employee can be involved in decisions

Scalar chain → hierarchy + lateral comm

Order → people & mat → Right place + Right time

Equity → Managers kind & fair

Stability of Tenure → ↓ Emp Turnover

Initiative → Employee originate & carry plans

Esprit de corps → promote team spirit

Key Differences:

o Focus → Fayol → Managerial process
(how act & organize work)
Weber → org struct (how org constructed)

Human Element → Fayol → consider ↓
Weber → more focus on efficiency / effectiveness

flexibility → more flexible & adaptability
→ rigid & strict

Quantitative Approach

→ applⁿ of mathematical models & stats to make informed & efficient management decision

Linear prog → opt res allocⁿ → min cost / max o/p

Major tech → Critical path method → help org plan & schedule proj & time req. to complete
Eco order Quantity → helps determine most efficient order size that min cost + inv management

Total Quality Management

- Customer focus → all aspect of org should work to satisfy customer
 - Continual Improvement → Always Strive for better perf
 - process orientⁿ → concentrate to optimize
 - Empowerment of Employees
- Ex: whole foods queing Theory & Queue management system in airports

Hawthorne studies & Behavioral Approach

- Understand^{ng} of human behaviour in org setting
- impact of social & psychological cond^{tn}s & social aspect of work place
Such as social norms & grp dynamic
interpersonal relⁿ & job satisfcⁿ

Job design → structured not only for efficiency but also satisfaction

Use of Behavioural approach → Teamwork → build effective teams

↳ Leadership → focus on various styles

↳ Communication → make open communication channel

↳ Employee Engagement → involve employee in decision making

Hawthorne Exp

1. Light Lvl → Test out physical condition by testing productivity with change in light, no correlation found as productivity seem to rise at both

(Mass Interview)

2. Attention from Managers → positively reacted from attention of supervisors/researchers, felt valued & cared boosting morale & productivity, employee attitude studied

3. Group Dynamic $\rightarrow$ all ^(b) female grp under Symphetic S.V increased productivity and Stabalized at lvl $\neq$ then pre test conditⁿ done

4. Bank Wiring $\rightarrow$ 14 workers, conditⁿ close to Norm, productⁿ record of $\searrow$ compared to earlier, Corp had own productⁿ Norm for each individual worker

Findings

- $\rightarrow$ Each indiv restricting o/p
- $\rightarrow$ group has unofficial std of performan
- $\rightarrow$ Indivd o/p $\rightarrow$ inst (mostly)

Contemporary Approach

System Theory

→ holistic view of org
→ complexity & dependence with ext env

→ How org functⁿ & interact with Ecosystem

1. Interdependence → all part of org from human → res → tech → process are connected one change can affect all
2. Open system → most org cont interact with ext Env, change res, info & energy
3. I/P, O/P model
4. Feedback loops → adjust & adapt

Contingency theory

- Transition from one size fits all to situat^{nl} & adaptability approach
- reflectⁿ of org are diverse
- En scientific approach want universal system but % of labour = monotonous
- Says no universally best way of management or size
 - larger → more struct to manage complexity
- dependent of
 - nature of task
 - Routine → Struct & hierarchy good
 - Innovative → dynamic & flexible good
 - Env uncertainty
 - stable → tradition
 - un → adaptive & decentralized
- indiv differences across Emp → understand diverse motivⁿ & capability via personalized approaches
